Commensalism - when organs live together & don't harm each other

Life Cycle

200,000 eggs a day - Child develops sooner than adult because child has smaller intestines.

Egg goes to soil & becomes embryonated. Look like a clear shell w/ granules. 2 wks in soil - inside egg you can see a small developing worm (embryo)

Stays as long as it takes to survive, & has to survive in human body.

King

Feces

Food

Glucose

Go to eggs & to stomach

acid digests protein shell

lose embryo (1 millimeter) or less in small intestine

Penetrates wall & enters blood stream

Enter portal vein & drain into liver & to heart then from

heart to lungs & pass if heavy enough

Symptom after back to lungs

1. can't breathe

2. Infection

Child cough or cold pneumonia
cough a lot of sputum.

Once it enters bld stream

Allergic Response - Another sign of

Swelling leg - fingers
aching hoarseness - blisters
swelling in lungs.

Crawl up away & get into back of throat

& then back into intestines to become adults they then

ovulate 200,000 eggs a day Live in Intestines

They get so large until it causes a blockage of bowel

Indigestion

(Lungs
Bacteraemia Tox)

Bacterial Wound

Diarrhea

Constipation

Feeling Distention in abdomen

Increased desire to eat

Coughing
Sneezing

1. Chills
2. High Fever

80-3-KKKK,

Hood Warm - Goes through rest of the life cycle goes through same life cycle as the ^{18 mos} ~~invertebrate~~ ^{invertebrate} Intestinal flukes. Live up to 18 yrs.

1. *T. pyruvum*
2. *T. luffe* - ^{EG-48T} Eliminated in China - Carried in human species & passed through rails. SH et al. 2001 until large outbreak
3. *H. antrois*
